Program Element: Seismic Networks

Key words: Seismicity, strong ground motion, seismotectonics,
real-time earthquake information

ABSTRACT

This Cooperative Agreement provides partial support for the joint USGS-Caltech Southern California Seismographic Network. The purpose is to record and analyze data from more than 11,952 local earthquakes from December 1997 to November 1998 and generate a database of phase data and digital seismograms. The primary product derived from the database is a joint USGS-Caltech catalog of earthquakes in the southern California region. The upgrade of the network instrumentation from analog to digital also continues. We also provide rapid response to emergency services, the media, and public inquiries about earthquakes.

For more detailed information about data access, please contact:
